Core Assets Intersects Widespread Porphyry Mineralization over 471 Metres at the Sulphide City Target and Rushes Assays for Silver Lime CRD Intercepts

- Diamond drilling over three additional holes at the Sulphide City Target has intersected impressive molybdenite-pyrite±chalcopyrite mineralization and moderate-to-intense porphyry-style vein densities (Figures 1-3).
- Select carbonate replacement deposit (CRD) intercepts observed in holes SLM22-001 (Jackie Target) and SLM22-011 (Grizzly Target) have been submitted for rushed analyses and results are expected in October.
